# Connect WordPress *(groundwork)*

*Let your helper read and draft on a WordPress site, signed in as a user you can revoke at any time.*

Kind Walkthrough (groundwork) | Changed 2026-11-04 | For The team that runs a WordPress site

**You are here:** drasticstatic lab › `my-template` › `walkthroughs` › `CONNECT-WORDPRESS.md` · public · `main` is the working branch

## TL;DR

1. **WordPress's official MCP Adapter lets AI helpers use a site's abilities** (posts, pages, media, plugins that opt in) through the open MCP standard.
2. **Your helper signs in as a WordPress user**, with an *application password* you create for it. That keeps it to what that user may do, and you can revoke it any time.
3. This page is groundwork. The team that runs a WordPress site finishes it for that site.

> ***Status:*** *groundwork, 2026-10-25. The PIR session owns the first real WordPress connection and will complete this guide from that experience.*

## How it fits together

1. **On the WordPress site:** install the MCP Adapter, which turns the site's abilities into MCP tools.
2. **Create a WordPress user for the helper** with only the role it needs (an *Editor* to draft posts, say, not an Administrator). Then create an **application password** for that user: **Users → Profile → Application Passwords**.
3. **In your helper's tool:** add the server with Automattic's remote bridge:

```
{
  "mcpServers": {
    "wordpress-mcp-server": {
      "command": "npx",
      "args": ["-y", "@automattic/mcp-wordpress-remote@latest"],
      "env": {
        "WP_API_URL": "https://yoursite.example/wp-json/mcp/mcp-adapter-default-server",
        "WP_API_USERNAME": "<the helper's user>",
        "WP_API_PASSWORD": "<its application password>"
      }
    }
  }
}
```

- The application password goes into the tool's own config on your computer. **Never into a repository, a chat or a document.**
- Revoke it from the same WordPress screen whenever you like.

## Good first requests

- *"List the ten most recent posts and their status."*
- *"Draft a post from this outline and save it as a draft. Don't publish."*
- *"Which pages mention our old address?"*

## Safety

- **The helper's user is the boundary.** Give it the smallest role that does the job. Drafts, not publishing, to begin with.
- **Keep a person on the publish button**, the same "rehearse first" spirit as the GitHub sites.

## Suggest a change

Noticed something wrong, or know a better way? Open an issue or a pull request against `main`; the lab steward reads them, and a person with the role merges with a merge commit so your name stays on it. Not on GitHub? Tell any steward you know, or your helper, in your own words.
